

# From Higher Spins to Strings

---

*Rajesh Gopakumar*

*Harish-Chandra Research Institute*

*Strings 2014, Princeton, June 24th, 2014*

*Based on: M. R. Gaberdiel and R. G.  
(arXiv:1406.tmrw and also 1305.4181)*

# Why are We Studying Higher Spin Theories?

- *Free YM theory has a tower of conserved currents dual to Vasiliev H-spin gauge fields (Sundborg, Witten).*
- *Signals the presence of a large unbroken symmetry phase of the string theory (Gross, Witten, Moore, Sagnotti et.al.).*
- *Can the Vasiliev H-Spin symmetries help to get a handle on the extended stringy symmetry in tensionless limit?*
- *AdS<sub>3</sub> might be a good test case since it already has Virasoro (and then extended to  $W_\infty$  - Henneaux-Rey, Campoleoni et.al.).*
- *Symmetric product CFT for D1-D5 system has been believed to be dual to tensionless limit of string theory.*

# The Punchline

*Vasiliev higher spin symmetry organises all the states of the  $(T^4)^{N+1}/S_{N+1}$  orbifold symmetric product CFT = Tensionless limit of strings on  $AdS_3 \times S^3 \times T^4$ .*

# Stringy Symmetries

*In particular:*

*The **chiral sector** (conserved currents) can be written in terms of representations of the higher spin symmetry algebra.*

$$\mathcal{Z}_{NS}(q, y) = \sum_{\Lambda \in U(N)} n(\Lambda) \chi_{(0; \Lambda)}(q, y)$$

*Chiral part of  
Symm. Prod.*

*multiplicity of  
 $S_{N+1}$  singlets in  $\Lambda$*

*Characters of  $\mathcal{N} = 4$   
minimal model  
coset:  $W_\infty$  reps.*

*Infinite (stringy) extension of  $W_\infty$  symmetry.*

# Explicitly.....

- *The vacuum character ( $\Lambda = 0$ ) contains the usual  $W_\infty$  generators - **bilinears in free fermions and bosons**.*
- ***Additional** chiral generators ( $\Lambda \neq 0$ ) can be written down explicitly in terms of free fermions and bosons.*

$$\Lambda = [2, 0 \dots, 0] \leftrightarrow \sum_{i=1}^{N+1} \psi_{-1/2}^{i\alpha} \psi_{-1/2}^{i\beta}$$

$$\Lambda = [0, 2, 0 \dots, 0] \leftrightarrow \sum_{i,j=1}^{N+1} \psi_{-1/2}^{i\alpha} \psi_{-1/2}^{j\beta} \psi_{-1/2}^{i\gamma} \psi_{-1/2}^{j\delta}$$

# Large $\mathcal{N} = 4$

- String theory on  $AdS_3 \times S^3 \times T^4$  has *small*  $\mathcal{N} = 4$  SUSY .
- Useful to consider via a limit of H-spin holography for *large*  $\mathcal{N} = 4$  *coset CFTs*. (Gaberdiel-R.G.)
- Large  $\mathcal{N} = 4$  SCA has *two* SU(2) Kac-Moody algebras. Thus labelled by one extra parameter:  $\gamma = \frac{k_-}{k_+ + k_-}$  .
- Small  $\mathcal{N} = 4$  obtained as a *contraction* -  $k_+ \rightarrow \infty$  .
- Only one SU(2) KM algebra at level  $k_-$  .

# Large $\mathcal{N} = 4$ Coset Holography

*The CFT:*

*4(N+1) free fermions*

$$\frac{\mathfrak{su}(N+2)_{\kappa}^{(1)}}{\mathfrak{su}(N)_{\kappa}^{(1)} \oplus \mathfrak{u}(1)^{(1)}} \oplus \mathfrak{u}(1)^{(1)} \cong \frac{\mathfrak{su}(N+2)_k \oplus \mathfrak{so}(4N+4)_1}{\mathfrak{u}(N)_{k+2}} \oplus \mathfrak{u}(1) .$$

$$c = \frac{6(k+1)(N+1)}{k+N+2} . \text{ Take 't Hooft limit } N, k \rightarrow \infty$$

$$\text{with } \lambda = \frac{N+1}{N+k+2} = \gamma \text{ fixed. (Gaberdiel-R.G.)}$$

*Has Large  $\mathcal{N} = 4$  (van Proeyen et.al., Sevrin et.al.) with*

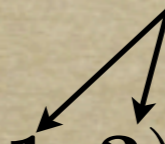

$$k_+ = (k+1); k_- = (N+1)$$

# Coset Holography (Contd.)

## *The H-Spin Dual:*

- *Vasiliev theory based on  $shs_2[\lambda]$  gauge group (Prokushkin-Vasiliev).*
- *One higher spin gauge supermultiplet for each spin  $s \geq 1$* 

$R^{(s)} :$	$s :$	$(\mathbf{1}, \mathbf{1})$	
	$s + \frac{1}{2} :$	$(\mathbf{2}, \mathbf{2})$	
	$s + 1 :$	$(\mathbf{3}, \mathbf{1}) \oplus (\mathbf{1}, \mathbf{3})$	$SU(2)$ labels 
	$s + \frac{3}{2} :$	$(\mathbf{2}, \mathbf{2})$	
	$s + 2 :$	$(\mathbf{1}, \mathbf{1}) .$	
- *Generates an asymptotic **super**  $W_\infty$  **algebra** which matches nontrivially with coset (Gaberdiel-Peng, Beccaria et.al.).*

# $W_\infty$ Representations

- *Primaries labelled by  $(\Lambda_+; \Lambda_-, u)$*   

$$\begin{array}{ccc} & \nearrow & \uparrow & \nwarrow \\ & \in \mathfrak{su}(N+2)_k & \in \mathfrak{su}(N)_{k+2} & \in \mathfrak{u}(1)_\kappa \text{ (will be omitted)} \end{array}$$

- $(0; \mathfrak{f}) \leftrightarrow$  “*Perturbative*” matter multiplets of *H-Spin theory* (with  $(0; \Lambda) \leftrightarrow$  multi-particles) (**Chang-Yin**).

$$h(0; \mathfrak{f}) = \frac{k + \frac{3}{2}}{N + k + 2} \rightarrow \frac{1 - \lambda}{2}$$

$$\mathcal{H}^{(\text{pert})} = \bigoplus_{\Lambda} (0; \Lambda) \otimes \overline{(0; \Lambda^*)} \subset \mathcal{H}^{(\text{diag})} = \bigoplus_{\Lambda_+, \Lambda_-} (\Lambda_+; \Lambda_-) \otimes \overline{(\Lambda_+^*; \Lambda_-^*)}$$

Contains “light states”

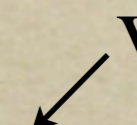

# Continuous Orbifold

- *Untwisted sector*:  $U(N)$  singlets formed from fermions/bosons.

*E.g.*  $(0; \bar{f}) \otimes \overline{(0; f)} \leftrightarrow \psi^{\bar{i}\alpha} \tilde{\psi}^{i\beta}$  ; ( *Note*:  $h(0; f) = \frac{1-\lambda}{2} \xrightarrow{k \rightarrow \infty} \frac{1}{2}$  )

- *More generally,*

$$\mathcal{H}_{\text{untwisted}} = \bigoplus_{\Lambda} (0; \Lambda) \otimes \overline{(0; \Lambda^*)} = \mathcal{H}^{(\text{pert})}$$

 Vasiliev States

Similar to bosonic and  $\mathcal{N} = 2$  cases  
 (Gaberdiel-Suchanek, Gaberdiel-Kelm)

- *Twisted Sector*: Continuous twists ( $U(N)$  holonomies) leads to a continuum (incl. light states). Labelled by  $(\Lambda_+; \Lambda_-)$  :  $w / \Lambda_+ \neq 0$ .

# A Tale of Two Orbifolds

- How do we *relate*  $(T^4)^{N+1}/U(N)$  to  $(T^4)^{N+1}/S_{N+1}$  ?
- $S_{N+1} \subset U(N)$  and  $\mathbf{N}, \bar{\mathbf{N}} \rightarrow N$   $\longleftarrow$   $N$  Dim. Irrep. of  $S_{N+1}$

*Bosons:*  $2 \cdot (\mathbf{N}, \mathbf{1}) \oplus 2 \cdot (\bar{\mathbf{N}}, \mathbf{1}) \oplus 4 \cdot (\mathbf{1}, \mathbf{1}) \rightarrow 4 \cdot (N, \mathbf{1}) \oplus 4 \cdot (\mathbf{1}, \mathbf{1})$

*Fermions:*  $(\mathbf{N}, \mathbf{2}) \oplus (\bar{\mathbf{N}}, \mathbf{2}) \oplus 2 \cdot (\mathbf{1}, \mathbf{2}) \rightarrow 2 \cdot (N, \mathbf{2}) \oplus 2 \cdot (\mathbf{1}, \mathbf{2})$

*How fermions and bosons in usual symmetric product orbifold transform*

$$\Rightarrow (T^4)^{N+1}/U(N) \Big|_{\text{untwisted}} \subset (T^4)^{N+1}/S_{N+1} \Big|_{\text{untwisted}}$$

# Two Orbifolds (Contd.)

- *Therefore:*

$$\mathcal{H}^{(\text{pert})} = \bigoplus_{\Lambda} (0; \Lambda) \otimes \overline{(0; \Lambda^*)} \subset \mathcal{H}^{(\text{Sym.Prod.})} \Big|_{\text{untwisted}}$$

- *i.e. Vasiliev states are a closed subsector of the Symmetric Product CFT = Tensionless string theory.*
- *More generally, states of the symmetric product CFT must transform in specific representations of the chiral algebra of the continuous orbifold (the  $U(N)$  invariant i.e.  $W_{\infty}$  currents).*

$$Z_{\text{NS}}(q, \bar{q}, y, \bar{y}) = |\mathcal{Z}_{\text{vac}}(q, y)|^2 + \sum_j |\mathcal{Z}_j^{(\text{U})}(q, y)|^2 + \sum_{\beta} |\mathcal{Z}_{\beta}^{(\text{T})}(q, y)|^2$$

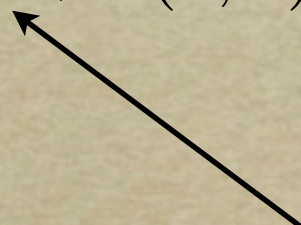

Other untwisted sectors

Twisted sectors

# Stringy Chiral Algebra

- The *vacuum sector* ( $S_{N+1}$  invariant currents) can therefore be organised in terms of coset ( $W_\infty$ ) representations - from the untwisted sector of the continuous orbifold.

$$\mathcal{Z}_{\text{vac}}(q, y) = \sum_{\Lambda \in U(N)} n(\Lambda) \chi_{(0; \Lambda)}(q, y)$$

- Each such representation comes with a *multiplicity* which would be given by the number of times the singlet of  $S_{N+1}$  appears in the  $U(N)$  representation  $\Lambda$ .
- A *vast extension* of  $W_\infty$  - generators not just bilinear in fermions/bosons but also cubic, quartic etc.

# Reality Check

- Explicitly *verify this equality* to low orders - use DMVV prescription to compute

$$\begin{aligned} \mathcal{Z}_{\text{vac}}(q, y) = & 1 + (2y + 2y^{-1})q^{\frac{1}{2}} + (2y^2 + 12 + 2y^{-2})q \\ & + (2y^3 + 32y + 32y^{-1} + 2y^{-3})q^{\frac{3}{2}} \\ & + (2y^4 + 52y^2 + 159 + 52y^{-2} + 2y^{-4})q^2 \\ & + (2y^5 + 62y^3 + 426y + 426y^{-1} + 62y^{-3} + 2y^{-5})q^{\frac{5}{2}} \\ & + (2y^6 + 64y^4 + 767y^2 + 1800 + 767y^{-2} + 64y^{-4} + 2y^{-6})q^3 \\ & + O(q^{\frac{7}{2}}) . \end{aligned}$$

# It Agrees!

Vasiliev higher spin fields

Additional higher spin generators :  $\sum_i \psi_{-\frac{1}{2}}^{i\alpha} \psi_{-\frac{1}{2}}^{i\beta}$

$$\begin{aligned}
 \mathcal{Z}_{\text{vac}}(q, y) = & \chi_{(0;0)}(q, y) + \chi_{(0;[2,0,\dots,0])}(q, y) + \chi_{(0;[0,0,\dots,0,2])}(q, y) \\
 & + \chi_{(0;[3,0,\dots,0,0])}(q, y) + \chi_{(0;[0,0,0,\dots,0,3])}(q, y) + \chi_{(0;[2,0,\dots,0,1])}(q, y) \\
 & + \chi_{(0;[1,0,0,\dots,0,2])}(q, y) + 2 \cdot \chi_{(0;[4,0,\dots,0,0])}(q, y) + 2 \cdot \chi_{(0;[0,0,0,\dots,0,4])}(q, y) \\
 & + \chi_{(0;[0,2,0,\dots,0,0])}(q, y) + \chi_{(0;[0,0,\dots,0,2,0])}(q, y) + \chi_{(0;[3,0,\dots,0,1])}(q, y) \\
 & + \chi_{(0;[1,0,0,\dots,0,3])}(q, y) + 2 \cdot \chi_{(0;[2,0,0,\dots,0,2])}(q, y) + \chi_{(0;[1,2,0,\dots,0])}(q, y) \\
 & + \chi_{(0;[0,\dots,0,2,1])}(q, y) + \chi_{(0;[2,1,0,\dots,0,1])}(q, y) + \chi_{(0;[1,0,\dots,0,1,2])}(q, y) \\
 & + \chi_{(0;[0,2,0,\dots,0,1])}(q, y) + \chi_{(0;[1,0,\dots,0,2,0])}(q, y) + 3 \cdot \chi_{(0;[3,0,\dots,0,2])}(q, y) \\
 & + 3 \cdot \chi_{(0;[2,0,\dots,0,3])}(q, y) + \chi_{(0;[1,1,0,\dots,0,2])}(q, y) + \chi_{(0;[2,0,\dots,0,1,1])}(q, y) \\
 & + \chi_{(0;[0,0,2,0,\dots,0])}(q, y) + \chi_{(0;[0,\dots,0,2,0,0])}(q, y) + 3 \cdot \chi_{(0;[0,2,0,\dots,0,2])}(q, y) \\
 & + 3 \cdot \chi_{(0;[2,0,\dots,0,2,0])}(q, y) + \chi_{(0;[1,1,0,\dots,0,1,1])}(q, y) + \mathcal{O}(q^{7/2}) .
 \end{aligned}$$

# Reality Check (Contd.)

- Can do something similar for the *simplest non-trivial untwisted sector* - which contains 16 of the 20 marginal ops.

$$\mathcal{Z}_1^{(U)}(q, y) = \sum_{\Lambda} n_1(\Lambda) \chi_{(0; \Lambda)}(q, y)$$

Contains  $\psi_{-\frac{1}{2}}^{i\alpha}$

Multiplicity of **N dim.** irrep of  $S_{N+1}$  in  $\Lambda$

- *Compute LHS*

$$\begin{aligned} \mathcal{Z}_1(q, y) &= (2y + 2y^{-1})q^{1/2} + (5y^2 + 16 + 5y^{-2})q^1 \\ &+ (6y^3 + 58y + 58y^{-1} + 6y^{-3})q^{3/2} \\ &+ (6y^4 + 128y^2 + 315 + 128y^{-2} + 6y^{-4})q^2 \\ &+ (6y^5 + 198y^3 + 1030y + 1030y^{-1} + 198y^{-3} + 6y^{-5})q^{5/2} \\ &+ (6y^6 + 240y^4 + 2290y^2 + 4724 + 2290y^{-2} + 240y^{-4} + 6y^{-6})q^3 \\ &+ \mathcal{O}(q^3) . \end{aligned}$$

# Agrees too....

(0;f) contribution

$$\begin{aligned}
 Z_1(q, y) = & \chi_{(0;[1,0,\dots,0])}(q, y) + \chi_{(0;[0,\dots,0,1])}(q, y) + \chi_{(0;[1,0,\dots,0,1])}(q, y) \\
 & + \chi_{(0;[2,0,\dots,0])}(q, y) + \chi_{(0;[0,0,\dots,0,2])}(q, y) + \chi_{(0;[1,1,0,\dots,0])}(q, y) \\
 & + \chi_{(0;[0,\dots,0,1,1])}(q, y) + 2 \cdot \chi_{(0;[2,0,\dots,0,1])}(q, y) + 2 \cdot \chi_{(0;[1,0,0,\dots,0,2])}(q, y) \\
 & + \chi_{(0;[0,2,0,\dots,0,0])}(q, y) + \chi_{(0;[0,0,\dots,0,2,0])}(q, y) + 2 \cdot \chi_{(0;[3,0,\dots,0,0])}(q, y) \\
 & + 2 \cdot \chi_{(0;[0,0,0,\dots,0,3])}(q, y) + 2 \cdot \chi_{(0;[1,1,0,\dots,0,1])}(q, y) + 2 \cdot \chi_{(0;[1,0,\dots,0,1,1])}(q, y) \\
 & + 5 \cdot \chi_{(0;[2,0,\dots,0,2])}(q, y) + \chi_{(0;[0,1,0,\dots,0,2])}(q, y) + \chi_{(0;[2,0,\dots,0,1,0])}(q, y) \\
 & + 2 \cdot \chi_{(0;[2,1,0,\dots,0])}(q, y) + 2 \cdot \chi_{(0;[0,\dots,0,1,2])}(q, y) + \chi_{(0;[0,1,1,0,\dots,0])}(q, y) \\
 & + \chi_{(0;[0,\dots,0,1,1,0])}(q, y) + 3 \cdot \chi_{(0;[0,2,0,\dots,0,1])}(q, y) + 3 \cdot \chi_{(0;[1,0,\dots,0,2,0])}(q, y) \\
 & + 4 \cdot \chi_{(0;[3,0,\dots,0,1])}(q, y) + 4 \cdot \chi_{(0;[1,0,0,\dots,0,3])}(q, y) + 5 \cdot \chi_{(0;[1,1,0,\dots,0,2])}(q, y) \\
 & + 5 \cdot \chi_{(0;[2,0,\dots,0,1,1])}(q, y) + \chi_{(0;[0,1,0,\dots,0,1,1])}(q, y) + \chi_{(0;[1,1,0,\dots,0,1,0])}(q, y) \\
 & + 3 \cdot \chi_{(0;[4,0,\dots,0,0])}(q, y) + 3 \cdot \chi_{(0;[0,0,0,\dots,0,4])}(q, y) + 3 \cdot \chi_{(0;[1,2,0,\dots,0])}(q, y) \\
 & + 3 \cdot \chi_{(0;[0,\dots,0,2,1])}(q, y) + \chi_{(0;[0,0,2,0,\dots,0])}(q, y) + \chi_{(0;[0,\dots,0,2,0,0])}(q, y) \\
 & + 4 \cdot \chi_{(0;[2,1,0,\dots,0,1])}(q, y) + 4 \cdot \chi_{(0;[1,0,\dots,0,1,2])}(q, y) + 2 \cdot \chi_{(0;[0,1,1,0,\dots,0,1])}(q, y) \\
 & + 2 \cdot \chi_{(0;[1,\dots,0,1,1,0])}(q, y) + \chi_{(0;[1,0,1,0,\dots,0,2])}(q, y) + \chi_{(0;[2,0,\dots,0,1,0,1])}(q, y) \\
 & + 7 \cdot \chi_{(0;[0,2,0,\dots,0,2])}(q, y) + 7 \cdot \chi_{(0;[2,0,\dots,0,2,0])}(q, y) + 9 \cdot \chi_{(0;[3,0,\dots,0,2])}(q, y) \\
 & + 9 \cdot \chi_{(0;[2,0,\dots,0,3])}(q, y) + 2 \cdot \chi_{(0;[0,1,0,\dots,0,2,0])}(q, y) + 2 \cdot \chi_{(0;[0,2,0,\dots,0,1,0])}(q, y) \\
 & + 2 \cdot \chi_{(0;[0,1,0,\dots,0,3])}(q, y) + 2 \cdot \chi_{(0;[3,0,\dots,0,1,0])}(q, y) + 6 \cdot \chi_{(0;[1,1,0,\dots,0,1,1])}(q, y) \\
 & + \mathcal{O}(q^{7/2}) ,
 \end{aligned}$$

# Twisted Sector

- A similar reorganisation also works for the *twisted sectors* of the symmetric product.
- Have studied the *2-cycle* twisted sector - contains the other four marginal operators.

$$\mathcal{Z}_{\pm}^{(2)}(q, y) = \sum_{\Lambda'_-, l_0; \mp 1} \tilde{n}(\Lambda'_-) \chi_{([\frac{k}{2}, 0, \dots, 0]; [\frac{k}{2} + l_0, \Lambda'_-])}(q, y)$$

Multiplicity of  $S_{N-1}$  singlets in  $\Lambda'_-$

- Again explicit answers check.

# Miscellaneous Remarks

- Can also refine this organisation of the spectrum into *single and multiparticle states* (indecomposable singlets of  $S_{N+1}$ ).
- If we associate the free fermions/bosons with Cartan elements of an adjoint valued field ( $\phi_i \rightarrow \Phi_{ii}$ ), then additional single particle currents which are higher order polynomials.

$$\sum_{i=1}^{N+1} \phi_i^4 \sim \text{Tr} \Phi^4$$

- *Higher Regge trajectories* compared to the leading one - *Vasiliev states*.
- Note, *no light states* (as for adjoint theories)  $\longleftrightarrow$  not local w.r.t. stringy chiral algebra (non-diagonal modular invariant).

# Looking Back

---

*Essentially we have:*

- *Identified* the Vasiliev states as a subsector of the symmetric product CFT.
- *Assembled* the full spectrum of the tensionless string theory in terms of representations of the super  $W_\infty$  algebra.
- *Characterised* the full set of massless higher spin states at this point in terms of  $W_\infty$  representations - a huge unbroken stringy symmetry algebra.

# Looking Ahead

- Understand the *higgsing of the stringy symmetries* in going away from the tensionless point (deforming by marginal op.).
- Does it constrain the spectrum, 3-point functions?
- Is there a relation to *integrability* in the underlying worldsheet theory?
- Can one understand the string theory on  $AdS_3 \times S^3 \times S^3 \times S^1$  in a similar way?
- Is there a lift to higher dimensional theories (Cf. [Beem et.al.](#)) ?
- Also relation to *ABJ triality* ([Chang et.al.](#)) and to proposal for free super Yang-Mills spectrum ([Beisert, Bianchi et.al.](#)), and multiparticle HS algebra ([Vasiliev](#)) ?

Thank You
